

Wandera from Adam Phones

Delivering data management
and mobile threat defence

Wandera, a managed service from Adam Phones, enables organisations to manage and control their mobile data usage and protect against mobile threats, such as malware, device data leaks and the identification of rogue Wi-Fi hotspots.

An on-device application (supported across all major mobile operating systems) is supplemented by an advanced online portal for administrators to enforce policies, restrict access to content and applications, and evaluate any detected threats.

Deployment via SMS - or one of the leading MDM / EMM solutions (including Microsoft Intune and AirWatch) - along with simple per seat licensing makes Wandera from Adam Phones a compelling ally in the fight against roaming data bill shock and global cyber-security threats.

Data Management licence includes:

Configure and deploy content filtering to define which 'data hungry' services employees can access, such as Netflix and Spotify

Create and enforce policies that control mobile data usage depending on overseas location, enabling you to target and mitigate high-cost destinations

Create threshold notifications that provide the visibility to set caps and control data usage

Compress mobile data in real-time to reduce data usage by over 10 percent

Threat Defence licence includes:

Revoke access to unsanctioned cloud storage services, such as Dropbox and Google Drive

Enforce browser restrictions that block advertising and restrict access to specific content, such as gambling and adult content

Benefit from real-time traffic scans that identify websites and apps that leak device data, along with suspicious Wi-Fi hotspots

Identify vulnerable device configurations, such as an outdated OS or evidence of jailbreaking

To learn more about how we can help you control your mobile expenditure and protect your devices from threats, call us on Freephone 0800 123000.
